- Inequalities involving bottlenecks
- 4 Fixing Block Inequalities
- 5 Inductive Lemmas

• A word is **repetitive** if it contains two consecutive identical blocks. A word *barbarian* is repetitive, while *civilized* is not.

- A word is **repetitive** if it contains two consecutive identical blocks. A word *barbarian* is repetitive, while *civilized* is not.
- A word containing k consecutive identical blocks is said to contain a k **power**.
  - A word *barbarian* contains **2 power**.

- A word is **repetitive** if it contains two consecutive identical blocks. A word *barbarian* is repetitive, while *civilized* is not.
- A word containing k consecutive identical blocks is said to contain a k **power**.
  - A word *barbarian* contains **2 power**.
- A sequence {s<sub>n</sub>}<sub>n=1</sub><sup>∞</sup> is non-repetitive up to mod r if each of its mod k subsequences {s<sub>nk+j</sub>}<sub>n=1</sub><sup>∞</sup> is non-repetitive, 1 ≤ k ≤ r, 0 ≤ j ≤ k − 1.

- A word is **repetitive** if it contains two consecutive identical blocks. A word *barbarian* is repetitive, while *civilized* is not.
- A word containing k consecutive identical blocks is said to contain a k **power**.

A word *barbarian* contains **2 power**.

- A sequence {s<sub>n</sub>}<sup>∞</sup><sub>n=1</sub> is non-repetitive up to mod r if each of its mod k subsequences {s<sub>nk+j</sub>}<sup>∞</sup><sub>n=1</sub> is non-repetitive, 1 ≤ k ≤ r, 0 ≤ j ≤ k − 1.
- A non-empty set L of infinite words is **perfect** if for any u ∈ L and any n there is a word v ∈ L, v ≠ u such that u and v have a common prefix of length at least n.

- A word is **repetitive** if it contains two consecutive identical blocks. A word *barbarian* is repetitive, while *civilized* is not.
- A word containing k consecutive identical blocks is said to contain a k **power**.
  - A word *barbarian* contains **2 power**.
- A sequence {s<sub>n</sub>}<sup>∞</sup><sub>n=1</sub> is non-repetitive up to mod r if each of its mod k subsequences {s<sub>nk+j</sub>}<sup>∞</sup><sub>n=1</sub> is non-repetitive, 1 ≤ k ≤ r, 0 ≤ j ≤ k − 1.
- A non-empty set L of infinite words is **perfect** if for any u ∈ L and any n there is a word v ∈ L, v ≠ u such that u and v have a common prefix of length at least n.
- A language *L* is perfect if its set of infinite words is perfect.

There are infinite words over the three letter alphabet  $\{a, b, c\}$  which are non-repetitive.

Image: A matched block

There are infinite words over the three letter alphabet  $\{a, b, c\}$  which are non-repetitive. For any alphabet  $\Sigma$  and any positive integer k the set of inifinite k power free words over  $\Sigma$  is perfect whenever it is nonempty.

There are infinite words over the three letter alphabet  $\{a, b, c\}$  which are non-repetitive. For any alphabet  $\Sigma$  and any positive integer k the set of inifinite k power free words over  $\Sigma$  is perfect whenever it is nonempty.

### Problem 1.1.

Let L be the set of infinite words over  $\Sigma$  which are non-repetitive up to mod r. Is L perfect?

The meet of words is their longest common prefix.
 2122 ∧ 211 = 21

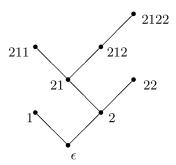

- The meet of words is their longest common prefix.
   2122 ∧ 211 = 21
- The **length** of a word is the number of letters in it.

$$|2122| = 4$$

- The meet of words is their longest common prefix.
   2122 ∧ 211 = 21
- The length of a word is the number of letters in it.
   |2122| = 4
- $\hat{v}$  is an upper cover of v if  $v < \hat{v}$ , but there is no  $z \in L$  such that  $v < z < \hat{v}$ .

- The meet of words is their longest common prefix.
   2122 ∧ 211 = 21
- The **length** of a word is the number of letters in it. |2122| = 4
- $\hat{v}$  is an upper cover of v if  $v < \hat{v}$ , but there is no  $z \in L$  such that  $v < z < \hat{v}$ .
- Given words  $u \leq v$  in *L*, the closed interval [u, v] is the set  $\{w \in L : u \leq w \leq v\}$ .  $[u, \infty] = \{w \in L : u \leq w\}$

•  $u \leq v$ 

→ < Ξ →</p>

- *u* ≤ *v*
- $[\hat{v},\infty]$  is infinite for at most one upper cover  $\hat{v}$  of v.

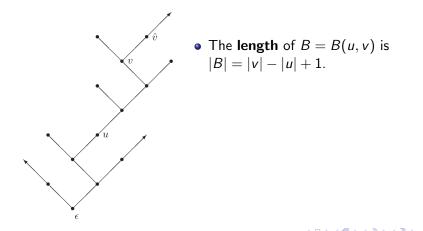

- *u* ≤ *v*
- $[\hat{v},\infty]$  is infinite for at most one upper cover  $\hat{v}$  of v.
- $[u,\infty] \setminus [v,\infty]$  is finite.

- *u* ≤ *v*
- $[\hat{v}, \infty]$  is infinite for at most one upper cover  $\hat{v}$  of v.
- $[u,\infty] \setminus [v,\infty]$  is finite.

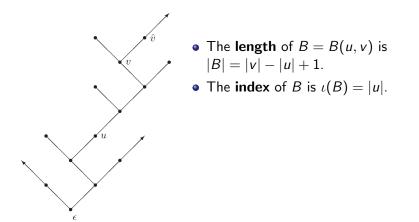

In this case any path in L from u to  $\infty$  must traverse the vertices of  $[u, \hat{v}]$ .

We refer to the set  $B(u, v) = [u, \infty] \setminus [\hat{v}, \infty]$  as a bottleneck with **core** [u, v]. If  $[v, \infty]$  is finite, let  $B(u, v) = [u, \infty]$ .

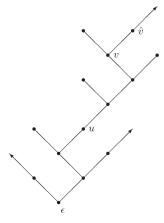

We refer to the set  $B(u, v) = [u, \infty] \setminus [\hat{v}, \infty]$  as a bottleneck with **core** [u, v]. If  $[v, \infty]$  is finite, let  $B(u, v) = [u, \infty]$ .

We refer to the set  $B(u, v) = [u, \infty] \setminus [\hat{v}, \infty]$  as a bottleneck with **core** [u, v]. If  $[v, \infty]$  is finite, let  $B(u, v) = [u, \infty]$ .

We refer to the set  $B(u, v) = [u, \infty] \setminus [\hat{v}, \infty]$  as a bottleneck with **core** [u, v]. If  $[v, \infty]$  is finite, let  $B(u, v) = [u, \infty]$ .

- The **length** of B = B(u, v) is |B| = |v| |u| + 1.
- The index of B is  $\iota(B) = |u|$ .

Suppose that  $w \leq y$  are elements of [u, v]. It follows that at most one cover of y has an infinite extension and we can form a bottleneck B(w, y).

## 1 Introduction

- 2 Bottlenecks
- Inequalities involving bottlenecks
  - 4 Fixing Block Inequalities

### 5 Inductive Lemmas

Our approach is to show that long bottlenecks in L must occur far out.

# Inequality 1. $\iota(B) \ge f(|B|)$ , whenever $|B| > N_0$

Here  $N_0$  is some constant, while f is eventually increasing and unbounded.

Our approach is to show that long bottlenecks in L must occur far out.

# Inequality 1. $\iota(B) \ge f(|B|)$ , whenever $|B| > N_0$

Here  $N_0$  is some constant, while f is eventually increasing and unbounded. Suppose now that Inequality 1 holds. The existence of such an inequality gives information about the structure of L.

Let  $g > N_0$  be a function such that for any non-negative integer M we have f(x) > M whenever x > g(M).

Let  $g > N_0$  be a function such that for any non-negative integer M we have f(x) > M whenever x > g(M).

#### Theorem 3.1.

Word  $u \in L$  is a prefix of infinitely many words in L if and only if L contains a word v > u, with |v| - |u| = g(|u|).

Let  $g > N_0$  be a function such that for any non-negative integer M we have f(x) > M whenever x > g(M).

### Theorem 3.1.

Word  $u \in L$  is a prefix of infinitely many words in L if and only if L contains a word v > u, with |v| - |u| = g(|u|).

#### Proof.

It suffices to prove the if direction. Suppose that *L* contains a word v > u with |v| - |u| = g(|u|), but that  $[u, \infty]$  is finite. Since  $[u, \infty]$  is finite,  $B = B(u, v) = [u, \infty]$  is a bottleneck. We have  $\iota(B) = |u|$ , and |B| = |v| - |u| + 1 > g(|u|). By Inequality 1:

$$|u| = \iota(B) \ge f(|B|) = f(|v| - |u| + 1) > |u|$$

This is a contradiction.

Theorem 3.2.

Language L is infinite if and only if it contains a word of length g(0).

### Theorem 3.2.

Language L is infinite if and only if it contains a word of length g(0).

This is a special case  $(u = \varepsilon)$  of previous theorem.

### Theorem 3.2.

Language L is infinite if and only if it contains a word of length g(0).

This is a special case  $(u = \varepsilon)$  of previous theorem.

### Theorem 3.1.

Word  $u \in L$  is a prefix of infinitely many words in L if and only if L contains a word v > u, with |v| - |u| = g(|u|).

Theorem 3.3.

If L is infinite, then L is perfect.

### Theorem 3.3.

If L is infinite, then L is perfect.

### Proof.

Suppose that L is infinite but not perfect. There is some word  $u \in L$  with exactly one infinite extension. Let v > u be any finite prefix of the unique infinite extension of u. There will correspond a bottleneck B(u, v) of index |u| and length |v| - |u| + 1. Because |u| is fixed, but |v| can be made arbitrarily large, this violates lnequality 1.

### Theorem 3.3.

If L is infinite, then L is perfect.

### Proof.

Suppose that L is infinite but not perfect. There is some word  $u \in L$  with exactly one infinite extension. Let v > u be any finite prefix of the unique infinite extension of u. There will correspond a bottleneck B(u, v) of index |u| and length |v| - |u| + 1. Because |u| is fixed, but |v| can be made arbitrarily large, this violates lnequality 1.

Thus the infinite tree is constantly branching.

### Theorem 3.3.

If L is infinite, then L is perfect.

### Proof.

Suppose that L is infinite but not perfect. There is some word  $u \in L$  with exactly one infinite extension. Let v > u be any finite prefix of the unique infinite extension of u. There will correspond a bottleneck B(u, v) of index |u| and length |v| - |u| + 1. Because |u| is fixed, but |v| can be made arbitrarily large, this violates lnequality 1.

Thus the infinite tree is constantly branching.

## Theorem 3.4.

The set of non-repetitive words over  $\{1, 2, 3\}$  of length *n* grows exponentially.

- $w1 = 2312132312 \, 11 \notin L$ , suffix  $w_1 = 1$  has period 1.
- $w^2 = 231213231212 \notin L$ , suffix  $w_2 = 121$  has period 2.
- $w3 = 231213231213 \notin L$ , suffix  $w_3 = w$  has period 6.

• A word  $u = a_1 a_2 \dots a_n$  has a **period** t if  $a_i = a_{i+t}$  for  $1 \le i < i + t \le n$ .

• A maximal word is a word of L with no extension in L.

Let *L* be a set of non-repetitive words over  $\Sigma = \{1, 2, 3\}$ . An example of a maximal word in this case is w = 23121323121.

- $w1 = 2312132312 \, 11 \notin L$ , suffix  $w_1 = 1$  has period 1.
- $w^2 = 23121323 \frac{1212}{2} \notin L$ , suffix  $w_2 = 121$  has period 2.
- $w3 = 231213231213 \notin L$ , suffix  $w_3 = w$  has period 6.

For each letter  $s \in \Sigma$  such that  $ws \notin L$ , w must have a periodic suffix which is 'near square'. A maximal non-repetitive word has several such suffixes. We call them **fixing blocks**.

Fixing blocks are suffixes of non-repetitive words of the form *ycy* where *y* is a word of *L*, *c* a letter of  $\Sigma$ . The **period** of such a fixing block is I = |yc|.

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

## Fixing Blocks Inequalities

In a word with several periods, interference patterns can arise. For example, if an infinite periodic word has periods  $\alpha$  and  $\beta$ , it also has period  $\gamma = gcd(\alpha, \beta)$ . A more complicated interaction happens when two distinct non-repetitive words  $v_1$  and  $v_2$  end in fixing blocks, and we consider the possible interference of these blocks in the common prefix  $v_1 \wedge v_2$ .

In a word with several periods, interference patterns can arise. For example, if an infinite periodic word has periods  $\alpha$  and  $\beta$ , it also has period  $\gamma = gcd(\alpha, \beta)$ . A more complicated interaction happens when two distinct non-repetitive words  $v_1$  and  $v_2$  end in fixing blocks, and we consider the possible interference of these blocks in the common prefix  $v_1 \wedge v_2$ .

### Lemma 4.1.

For i = 1, 2, let  $v_i$  be a word of L with a fixing block suffix of period  $I_i$ . Suppose that:

- $I_2 \geqslant I_1$
- **2** Not both  $I_1 = I_2$  and  $|v_1| = |v_2|$

3 
$$I_2 > |v_2| - |v_1 \wedge v_2|$$

Then:

$$\mathit{I}_2 \geqslant 2\mathit{I}_1 - (|\mathit{v}_1| - |\mathit{v}_1 \wedge \mathit{v}_2|)$$

Using induction we can already show that reasonably long fixing blocks occur:

## Corollary 4.2.

For i = 1, ..., r, let  $v_i$  be a word in L with a fixing block of period  $I_i$ . Suppose that for i = 1, ..., r - 1 we have:

• 
$$I_{i+1} \ge I_i$$
  
• Not both  $I_i = I_{i+1}$  and  $|v_i| = |v_{i+1}|$   
•  $I_{i+1} > |v_{i+1}| - |v_i \land v_{i+1}|$   
Then:

$$I_r \ge 2^{r-1}I_1 - \sum_{j=1}^{r-1} 2^{r-1-j} (|v_j| - |v_j \wedge v_{j+1}|)$$

# Fixing Blocks Inequalities

### Corollary 4.3.

If v is a word of L with exactly d upper covers,  $d < |\Sigma|$ , then v ends in a fixing block of period  $\ge 2^{|\Sigma|-d-1}$ .

### Corollary 4.3.

If v is a word of L with exactly d upper covers,  $d < |\Sigma|$ , then v ends in a fixing block of period  $\ge 2^{|\Sigma|-d-1}$ .

We begin to get a glimmer of how we arrive at the very long fixing blocks in bottlenecks promised at the start of this section. A bottleneck, since it offers only one path to infinity, must feature many dead ends, i.e., maximal words. Such words offer sources of many fixing blocks.

### Corollary 4.3.

If v is a word of L with exactly d upper covers,  $d < |\Sigma|$ , then v ends in a fixing block of period  $\ge 2^{|\Sigma|-d-1}$ .

We begin to get a glimmer of how we arrive at the very long fixing blocks in bottlenecks promised at the start of this section. A bottleneck, since it offers only one path to infinity, must feature many dead ends, i.e., maximal words. Such words offer sources of many fixing blocks. Similar lemma can be shown in a language L of words non-repetitive up to mod r.

#### Lemma 4.4.

If v is a word of L with exactly d upper covers,  $d < |\Sigma|$ , then v ends in a fixing block of period  $\ge 2^{(|\Sigma|-d-1)/r}$ .

## 1 Introduction

- Inequalities involving bottlenecks
- 4 Fixing Block Inequalities

## 5 Inductive Lemmas

### We call bottleneck B = B(u, v) regular when

$$|B| \ge |w| - |w \wedge v| + 1$$
 for any  $w \in B$ 

We call bottleneck B = B(u, v) regular when

$$|B| \geqslant |w| - |w \wedge v| + 1$$
 for any  $w \in B$ 

Any bottleneck *B* contains a regular bottleneck of length |B|. (Just take the length *B* suffix of the longest maximal word in *B*.)

### Lemma 5.1.

Suppose there exist numbers m and  $\alpha, \alpha > 5$ , such that every regular bottleneck of length at least m contains a word with fixing block period at least  $\alpha m$ . Then each bottleneck of length at least 4m contains a word with a fixing block period of at least  $4m(2\alpha - 5)$ .

### Lemma 5.1.

Suppose there exist numbers m and  $\alpha, \alpha > 5$ , such that every regular bottleneck of length at least m contains a word with fixing block period at least  $\alpha m$ . Then each bottleneck of length at least 4m contains a word with a fixing block period of at least  $4m(2\alpha - 5)$ .

Induction gives the following:

### Lemma 5.2.

If every regular bottleneck of length at least m contains a word with a fixing block period at least  $\alpha m$ , for some  $\alpha > 5$ , then each bottleneck of length  $\ge 4^n m$  must contain a word with a fixing block period of at least  $4^n m(2^n(\alpha - 5))$ .

## Lemma 5.1.

Suppose there exist numbers m and  $\alpha, \alpha > 5$ , such that every regular bottleneck of length at least m contains a word with fixing block period at least  $\alpha m$ . Then each bottleneck of length at least 4m contains a word with a fixing block period of at least  $4m(2\alpha - 5)$ .

Induction gives the following:

### Lemma 5.2.

If every regular bottleneck of length at least m contains a word with a fixing block period at least  $\alpha m$ , for some  $\alpha > 5$ , then each bottleneck of length  $\ge 4^n m$  must contain a word with a fixing block period of at least  $4^n m(2^n(\alpha - 5))$ .

Suppose we can find such *m* and  $\alpha$ . Then Lemma 5.2. gives an inequality of the form of Inequality 1.

### Lemma 5.2.

If every regular bottleneck of length at least m contains a word with a fixing block period at least  $\alpha m$ , for some  $\alpha > 5$ , then each bottleneck of length  $\ge 4^n m$  must contain a word with a fixing block period of at least  $4^n m(2^n(\alpha - 5))$ .

When  $|\Sigma| > 4$ , the hypothesis of Lemma 5.2. can be shown to hold with  $m = 1, \alpha = 2^{|\Sigma|-2}$ , using Corollary 4.3.

### Lemma 5.2.

If every regular bottleneck of length at least m contains a word with a fixing block period at least  $\alpha m$ , for some  $\alpha > 5$ , then each bottleneck of length  $\ge 4^n m$  must contain a word with a fixing block period of at least  $4^n m(2^n(\alpha - 5))$ .

When  $|\Sigma| > 4$ , the hypothesis of Lemma 5.2. can be shown to hold with  $m = 1, \alpha = 2^{|\Sigma|-2}$ , using Corollary 4.3.

### Corollary 4.3.

If v is a word of L with exactly d upper covers,  $d < |\Sigma|$ , then v ends in a fixing block of period  $\ge 2^{|\Sigma|-d-1}$ .

### Lemma 5.2.

If every regular bottleneck of length at least m contains a word with a fixing block period at least  $\alpha m$ , for some  $\alpha > 5$ , then each bottleneck of length  $\ge 4^n m$  must contain a word with a fixing block period of at least  $4^n m(2^n(\alpha - 5))$ .

When  $|\Sigma| > 4$ , the hypothesis of Lemma 5.2. can be shown to hold with  $m = 1, \alpha = 2^{|\Sigma|-2}$ , using Corollary 4.3.

### Corollary 4.3.

If v is a word of L with exactly d upper covers,  $d < |\Sigma|$ , then v ends in a fixing block of period  $\ge 2^{|\Sigma|-d-1}$ .

As noted in Section 3, this gives the interesting result that for such  $\Sigma$ , the set of infinite non-repetitive words over  $\Sigma$  is perfect.

For the rest of this section, let L be the language of words over an alphabet  $\Sigma$  which are non-repetitive up to mod r. Let s be chosen so that

$$(2^{s-1} - (r(s-1) + 1)) > 0$$

Let  $\alpha$  be chosen so that

$$\alpha > 2(r(s-1)+1)$$

and

$$\alpha > \frac{2(r(s-1)+1)(2^{s-2}-1)}{2^{s-1}-(r(s-1)+1)}$$

### Lemma 5.3.

Suppose that every regular bottleneck of length m has a vertex with a fixing block of period at least  $\alpha m$ . Then every regular bottleneck of length at least (r(s-1)+1)m has a vertex with a fixing block of period at least  $\alpha(r(s-1)+1)m$ .

### Lemma 5.3.

Suppose that every regular bottleneck of length m has a vertex with a fixing block of period at least  $\alpha m$ . Then every regular bottleneck of length at least (r(s-1)+1)m has a vertex with a fixing block of period at least  $\alpha(r(s-1)+1)m$ .

### Proof sketch.

Let *B* be a regular bottleneck of length (r(s-1)+1)m. Divide the core of *B* into r(s-1)+1 disjoint paths, each of length *m*. Each of these paths is the core of a bottleneck of length *m*, therefore we can find r(s-1)+1 disjoint regular bottlenecks of length *m*, so r(s-1)+1 distinct vertices in *B*, each having a fixing block of period at least  $\alpha m$ . We apply Lemma from previous section and, by the choice of  $\alpha$ , we have

$$I_{r(s-1)+1} \ge \alpha(r(s-1)+1)m$$

## Inductive Lemmas

If we can find  $\alpha$  and m as in Lemma 5.3. we can get an inequality of form Inequality 1. This will enable us to show that L is perfect. However, it requires s and  $\alpha$  to be rather large. An induction can be started with  $r = 4, s = 6, \alpha = 630/13, m = 1$ , if  $|\Sigma| \ge 35$ ; this follows from Lemma 4.4. We get the following results:

## Inductive Lemmas

However, it requires s and  $\alpha$  to be rather large. An induction can be started with  $r = 4, s = 6, \alpha = 630/13, m = 1$ , if  $|\Sigma| \ge 35$ ; this follows from Lemma 4.4. We get the following results:

Theorem 5.4.

The set of infinite words over an alphabet  $\Sigma$  which are non-repetitive up to mod 4 is perfect if  $|\Sigma| \ge 35$ .

#### Theorem 5.5.

The set of infinite words over an alphabet  $\Sigma$  which are non-repetitive up to mod *r* is perfect if  $|\Sigma|$  is sufficiently large.

'Sufficiently large' can be replaced by a constructive condition based on first choosing s, then  $\alpha$ , then  $\Sigma$ .
